ABSTRACT

Word-Level Plagiarism Checker for Short Documents is a software application designed to detect plagiarism by comparing the words and phrases in short text documents. The system analyzes an input document and compares it with one or more reference documents to identify matching words, common sequences, and similarity percentages. It performs preprocessing steps such as converting text to lowercase, removing punctuation, eliminating stop words, and tokenizing the text into individual words. The processed words are then compared using word-level matching algorithms to calculate the degree of similarity between documents. The application generates a plagiarism report that highlights matched words, displays the similarity score, and indicates whether the document contains potential plagiarism. This project provides a simple, fast, and efficient solution for checking assignments, reports, essays, and other short documents. It helps students, teachers, and content creators maintain originality while reducing manual effort in detecting copied content. The system is lightweight, user-friendly, and can serve as a foundation for more advanced plagiarism detection techniques using natural language processing and machine learning.
